Floating stairs are a type of straight staircase that is self-supported. Because of the self-supported design a floating staircase requires no extra support between the underside of the staircase and the floor below or a wall. This unique design makes the staircase look like it is “floating” above the ground, giving this type of staircase its name. The main support of a floating staircase is the stringer or “backbone” of the staircase. Floating stairs utilize either a single stringer or dual stringers that provide a strong connection between landings and require no extra support between the floors. This design is utilized in a lot modern designs due to its contemporary look and versatile functionality, opening up additional floor space below the staircase.
