A floating-type wharf is a marine structure that floats on the water's surface, designed to provide docking and mooring facilities for vessels. Unlike fixed wharves, floating wharves are anchored to the seabed using mooring systems but can adjust to changes in water levels caused by tides or seasonal variations. Key features include their buoyant design, flexibility in adapting to fluctuating water levels, and ease of installation and relocation. Floating wharves are typically constructed using durable materials like steel, concrete, or high-density polyethylene to withstand harsh marine environments. They are widely used in ports, marinas, and industrial facilities, especially in areas with significant tidal ranges or where traditional fixed structures are less practical. Applications include passenger and cargo handling, recreational boating, aquaculture, and emergency or temporary docking solutions. Their versatility, cost-effectiveness, and adaptability to environmental conditions make them a popular choice for modern marine infrastructure.
