A floating valve tray is a type of tray used in distillation columns and other mass transfer equipment. It is composed of a tray deck with a certain shape of valve holes (round or rectangular). In each hole, there is a movable valve disc, which can move up and down according to the change of vapor flow rate. When there is no upward vapor phase, the valve disc closes on the tray; when the vapor phase rises, the valve disc is impacted by the vapor flow and opens upward, and the opening height increases with the increase of the vapor phase quantity. The rising vapor passes through the valve hole and is dispersed horizontally by the action of the valve disc, bubbling out through the liquid layer, so that the vapor - liquid two - phase can fully contact and achieve the ideal heat and mass transfer effect. Due to its excellent comprehensive performance, such as large production capacity, large operating flexibility, high tray efficiency, and low manufacturing cost, it has become one of the most widely used trays.
