The Production is about 35,000 units. A Flocculation Clarifier is a solid-liquid separation unit used in water and wastewater treatment. It typically works by adding coagulants or flocculants to aggregate fine suspended solids, colloidal particles, and impurities into larger flocs, which are then removed by gravity settling. The equipment usually integrates mixing, flocculation, sedimentation, and sludge discharge in one system. It can effectively reduce turbidity, suspended solids, and part of the pollutant load, providing more stable influent conditions for downstream filtration, membrane treatment, or advanced treatment. It is widely used in municipal water supply, wastewater treatment, industrial wastewater, chemical wastewater, mining wastewater, and circulating water treatment.
