A floor standing condensing boiler is a type of heating system commonly used in residential and commercial buildings to provide warmth and hot water. Unlike traditional boilers, which waste heat through the flue, condensing boilers are designed to capture and reuse much of that heat. They do this by condensing water vapor in the exhaust gases, releasing additional heat in the process. This makes them more energy-efficient and environmentally friendly compared to non-condensing boilers. The 'floor standing' aspect refers to their physical design, as they are typically larger units that stand on the floor rather than being wall-mounted. They are often chosen for their high efficiency, reliability, and ability to provide consistent heating and hot water.

The global Floor Standing Condensing Boiler market size is projected to grow from US\$ 1034 million in 2024 to US\$ 1392 million in 2030; it is expected to grow at a CAGR of 5.1% from 2024 to 2030.
