In flotation processes, foamers help to create ideal hydrodynamic conditions (such as bubble size and gas retention) required in the slurry of the flotation cell. The foam they produce is stable enough to keep the collected minerals above the pulp; Also has enough liquidity, easy to remove; Can also be rapidly attenuated to assist in downstream business. These characteristics play a vital role in the kinetic feasibility of the flotation process and the overall grade and recovery that can be obtained through the flotation cell or flotation process.
