In the oil and gas industry, the flowback process refers to recovering the fluid solution from a well operation after it has been hydraulically fractured. This fluid contains solids, chemicals, and other contaminants. The water is often murky and clouded due to the abundance of suspended particles. The volume recovered is usually less than half of the amount initially injected into the well. The proper disposal of reclaimed fluid is very important because disruption of the shale formation can result in contamination of surface or ground water.
