Influenza vaccines, also known as flu shots, are vaccines that protect against influenza. A new version of the vaccine is developed twice a year as the influenza virus rapidly changes. Most provide modest to high protection against influenza; however, each year this varies. Evidence in adults over 65 years old is poor. They decrease the number of missed days of work by a half day on average. Vaccinating children may protect those around them.

The classification of Flu Vaccine includes Whole Virus Vaccines, Split Virus Vaccines, Subunit Vaccines and Live Attenuated Virus Vaccines, and the proportion of Whole Virus Vaccines in 2016 is about 43%, and the proportion is in decreasing trend from 2012 to 2016.

Flu Vaccine is widely used for Children (6 months to 3 years) and for Adults and Children over 3 years. The most proportion of Flu Vaccine is For Adults and Children over 3 years, and the proportion in 2016 is about 75%.

The Europe in the EMEA is the largest consumption place, with a consumption market share nearly 80% in 2016.
