The global Flue Gas Sulphur Removal Solution market size is predicted to grow from US\$ 6794 million in 2025 to US\$ 11395 million in 2032; it is expected to grow at a CAGR of 8.5% from 2026 to 2032.

Flue Gas Desulphurisation (FGD) Solution is a treatment system for sulfur-containing flue gases produced during industrial combustion. Using wet, dry, semi-dry, circulating fluidized bed, or other absorption technologies, it effectively removes sulfur dioxide (SO₂) and other acidic components. The system typically includes absorption towers, spray or absorbent feed systems, slurry circulation units, demisters, monitoring and control systems, and by-product handling units such as gypsum or ammonium sulfate. FGD solutions are widely used in coal-fired power plants, steel, cement, chemical, waste incineration, and marine exhaust applications, ensuring compliance with environmental standards while improving desulfurization efficiency and operational economics.

Flue Gas Desulphurisation solutions are evolving toward higher efficiency, lower energy consumption, intelligent operation, and resource recovery. With increasingly stringent industrial emission standards, future FGD systems are expected to integrate with denitrification, dust removal, mercury and VOC control, while supporting remote monitoring and digital maintenance. Wet FGD remains dominant in large-scale power and heavy industries, but dry, semi-dry, and modular FGD systems will see more applications in small- to medium-sized boilers, waste incineration, cement kilns, and retrofit projects. Future upgrades will focus on by-product utilization, intelligent chemical dosing, online emission monitoring, and digital management, transforming FGD systems from standalone pollution control devices into efficient, intelligent, and low-carbon integrated treatment platforms.
