The Production is about 200,000 units. Fluid Jet Eductor is a hydraulic device that uses a high-pressure driving fluid to create a low-pressure zone through the Venturi effect, thereby entraining and transporting a secondary fluid without any moving parts. It consists of a nozzle, mixing chamber, and diffuser, where the motive fluid accelerates through the nozzle, draws in the suction fluid, and discharges the mixed flow at a higher pressure. Upstream, fluid jet eductors rely on pressurised water, steam, air, or other working fluids, together with piping and control valves. Downstream, they are widely applied in marine bilge stripping, sludge removal, chemical transfer, tank cleaning, vacuum generation, and wastewater handling, offering a simple, reliable, and maintenance-free solution for fluid transfer in harsh industrial and marine environments.
