The global Fluidised Bed Sand Cooling System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A fluidized bed sand cooling system is a type of industrial cooling system used to cool hot sand particles in foundry and other industrial processes. In this system, hot sand is fed into a fluidized bed chamber where it is mixed with cool air or gas. The sand particles are suspended in the air/gas stream, creating a fluidized bed that allows for efficient heat transfer and cooling.

As the hot sand particles come into contact with the cool air/gas, heat is transferred from the sand to the air/gas, effectively cooling the sand particles. The cooled sand is then discharged from the fluidized bed chamber for further processing or storage.

Fluidized bed sand cooling systems are commonly used in foundries to cool sand used in casting molds and cores. They offer advantages such as uniform cooling, efficient heat transfer, and reduced energy consumption compared to traditional cooling methods.
