A fluidized bed reactor is a dynamic catalyst evaluation device, typically used for studying liquid-phase catalytic reactions. The catalyst is usually filled into a fluidized bed, through which the reactants flow and react after passing over the catalyst. Compared to fixed-bed reactors, fluidized bed reactors have advantages such as high heat transfer efficiency, uniform concentration and temperature, and a wide operating range. They are particularly suitable for reaction systems with high heat release, high reaction rates, and catalysts prone to deactivation.
