The global Fluorescent Protein Excitation Observation System market size is predicted to grow from US$ 125 million in 2025 to US$ 159 million in 2031; it is expected to grow at a CAGR of 4.1% from 2025 to 2031.

The fluorescent protein excitation observation system is a combination of equipment or a technical system for observing the luminescence of fluorescent proteins. Fluorescent proteins are members of a class of structurally homologous proteins with the unique property of being self-sufficient and can form visible wavelength chromophores from three amino acid sequences within their own polypeptide sequences. Common fluorescent proteins include green fluorescent protein (GFP), red fluorescent protein (RFP), etc. Different fluorescent proteins require excitation light of different wavelengths. For example, green fluorescent protein usually requires blue light or ultraviolet light to be excited. The excitation light source can be a portable fluorescent protein excitation observation lamp, an excitation light source that comes with a fluorescence microscope, etc. The working principle of the fluorescent protein excitation observation system is based on the characteristic that fluorescent proteins emit fluorescence under the irradiation of an excitation light source. When the light emitted by the excitation light source shines on the fluorescent protein, the fluorescent protein absorbs the light energy and transitions to an excited state, and then releases fluorescence when it returns from the excited state to the ground state. These fluorescences can be observed through observation equipment, thereby realizing the observation of fluorescent proteins.
