Fluorinated Polyimide Monomer is a class of organic compounds containing fluorine elements and serves as an important precursor for the synthesis of fluorinated polyimides. It typically has a specific molecular structure, and the introduction of fluorine atoms endows the monomer with unique chemical and physical properties. Fluorinated Polyimide Monomer exhibits high reactivity and can undergo polycondensation reactions with other diamines, dianhydrides, and other monomers to form fluorinated polyimide polymers with excellent properties. Due to the presence of fluorine elements, fluorinated polyimide polymers demonstrate good thermal stability, low dielectric constants, low water absorption rates, as well as excellent mechanical and chemical stability. They have broad application prospects in fields such as microelectronics, aerospace, and optoelectronics, and are used, for example, in the manufacture of high-performance integrated circuit packaging materials and flexible circuit board substrates.

United States market for Fluorinated Polyimide Monomer is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
