The global Fluorine-Based Grease for Aerospace market size is predicted to grow from US\$ 162 million in 2025 to US\$ 240 million in 2032; it is expected to grow at a CAGR of 5.5% from 2026 to 2032.

Global sales of fluorine-based greases for aerospace reached 536 tons in 2025, with an average price of \$308/kg.

Aerospace fluorine-based greases are high-performance specialty lubricants made with perfluoropolyether (PFPE) or chlorofluorocarbon oils as base oils, combined with polytetrafluoroethylene (PTFE) or other fluorinated thickeners. These greases possess extreme temperature adaptability (-90° to above 300°), chemical inertness (resistance to strong acids and alkalis, and oxidants), extremely low volatility, and excellent material compatibility. They are specifically designed for extreme aerospace operating conditions, including high vacuum, strong radiation, high speed and heavy load, and harsh environments with drastic temperature fluctuations. Their core molecular structure is a perfluorinated carbon-oxygen backbone (such as the Fomblin®, Krytox®, and Demnum® series), produced through photo-oxidation or anionic polymerization of perfluoroolefins, representing the highest level of lubrication technology.

The raw material system of fluorinated greases uses perfluoroolefins as the core monomers, mainly including hexafluoropropylene (HFP) and tetrafluoroethylene (TFE), which are converted into perfluoropolyether base oils through photo-oxidation or anionic polymerization. The thickener uses high-purity polytetrafluoroethylene (PTFE) micropowder (typically
