The global Fluorine in Nitrogen market size is predicted to grow from US\$ 3908 million in 2025 to US\$ 4697 million in 2031; it is expected to grow at a CAGR of 3.1% from 2025 to 2031.

The potential toxicity of fluorinated gases may limit industry growth in the coming years. The flammability of a refrigerant refers to its ability to ignite and cause combustion or fire. Flammability is the ability of a mixture to propagate flame a specific distance on its own. Simply put, toxicity is the amount of a substance that turns it into a poison. All compounds have the potential to become toxic in large enough quantities. The dose required to produce harm, and in some cases repeated exposure, determines the difference between a safe substance and a toxic substance.
