The global Fluorine Pump Air Conditioner market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Fluorine pump air conditioners adopt an intelligent dual-cycle design. When the outdoor temperature is low in winter or transitional seasons, the refrigerant pump (fluorine pump) is used to circulate the refrigerant for outdoor heat exchange, making full use of outdoor natural cold sources. The 'fluorine pump' is not just a pump. This intelligent dual-cycle design eliminates the need to turn on the compressor for refrigeration for a certain period of time throughout the year, greatly reducing air conditioning energy consumption. It is a complete cycle system, including the evaporator inside the data center, the external air-cooled condenser, the refrigerant gas-liquid separator, the oil separator and the refrigerant circulation pump. It realizes compressor refrigeration and pump in the same refrigeration system. There are three circulation systems: system refrigeration and mixed refrigeration with compressor and pump.
