Abstracts

The global Fluoropolymer Dry Powder market size is predicted to grow from US\$ 1658 million in 2025 to US\$ 2428 million in 2032; it is expected to grow at a CAGR of 5.7% from 2026 to 2032.

Fluoropolymers like PTFE (Polytetrafluoroethylene), FEP (Fluorinated Ethylene Propylene), and PFA (Perfluoroalkoxy) are resistant to high temperatures, often withstanding up to 260°C (500°F) or more without degrading.

Powder coatings lack solvents, giving way to negligible volatile organic compound (VOC) emission into the atmosphere and reducing the risk of combustion during their usage and storage process. In addition, the powder can be easily washed when exposed to human skin, which reduces the risk of health problems for operators. ETFE is excellent in processability and able to form a thick and non-stick film layer with electrical, mechanical and chemical strength. FEP and PFA Coating Powder are low in melt viscosity and excellent in melt fluidity which can give a coating free of pinholes.
