## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

The flywheel uninterruptible power supply consists of a rectifier, a DC motor, a flywheel, a diesel engine (or petrol engine) and a generator. In the case of grid power supply, the DC power provided by the rectifier drives the motor to drive the flywheel and the generator to supply the load. Due to the inertia of the flywheel, the generator speed can be kept in balance and the uninterruptible power supply acts as a filter for grid disturbances at this time. When the grid is disconnected, the flywheel continues to drive the rotor of the generator and at the same time starts the diesel engine to drive the generator to generate electricity, replacing the original grid to supply the load.
