The global Foam Absorbing Material market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Foam absorbing material is a kind of composite material with remarkable absorbing ability to electromagnetic waves, whose main function is to absorb or weaken the electromagnetic wave energy received on its surface, thus reducing electromagnetic radiation or interference. Foam wave absorbing materials are usually composed of matrix materials and absorbents. The matrix materials are mostly light and flexible materials such as polyurethane (PU), while absorbents may include resistance type, medium type and magnetic loss type. These materials are formed into high permeability magnetic alloys through physical refinement and magnetic field treatment, and uniformly dispersed in polymers, thereby achieving absorption of electromagnetic waves. The principle is mainly to use mechanisms such as insulation loss, magnetic loss, and resistance loss to convert electromagnetic waves into thermal energy, thereby reducing electromagnetic radiation.

United States market for Foam Absorbing Material is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
