The global Foam Pouring System market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Foam pouring system is a system used to apply foam for fire suppression or firefighting purposes. It typically includes a foam concentrate storage tank, a foam proportioner, and a delivery system with nozzles or applicators. The foam concentrate is mixed with water in the proportioner, creating a foam solution, which is then delivered through the nozzles or applicators. Foam pouring systems are commonly used in industrial settings, oil refineries, airports, and other facilities where flammable liquid fires or Class B fires may occur. The foam acts as a fire suppressant and forms a barrier to separate the fuel source from the oxygen, preventing fire spread and re-ignition.
