A foam system is usually specified for cone roof tanks. Foam in powder form is mixed with water and forms foam suds. This is done in a foam-mixing unit located inside a foam pump house. The foam is then pumped to foam chambers located at the top of tanks, which are mounted on the inside wall so as to blanket the surface of the tank liquid with foam and snuff the fire.

Two basic types of foam systems are used in the fire service and industry. The least expensive is a portable system made up of a foam proportioner, hose and a foam nozzle. This system is portable and may be moved to any location, as long as water at the proper pressure can be delivered. The second type of system is a vehicle-mounted system. This system is permanently mounted on the engine.
