The focused droplet generation chip is a device that generates droplets through microfluidics technology, using the principle of focused flow to accurately control the size and frequency of droplets. It generates droplets of uniform size and stable structure by converging two or more fluids in a microchannel to form shear force. The chip is widely used in single cell analysis, microreactors, drug screening, and emulsion preparation. The focused droplet generation chip has the advantages of high throughput and controllable precision, and is suitable for complex biological and chemical experiments.
