The report requires updating with new data and is sent in 48 hours after order is placed.

The focused shock wave apparatus use an electromagnetically generated shock wave produced within a hand-held applicator (F-SW Hand piece). The shock wave is generated by discharging a high voltage capacitor located in the control unit into a cylindrically shaped coil system in the handpiece which is surrounded by a cylindrical metallic membrane. The transient magnetic field produced by the coil induces eddy currents in the metal membrane, causing it to repel from the coil, producing a pressure wave. The membrane is immersed in water and the pressure wave produced by the membrane propagates through the water to a concentric parabolic reflector, where it is reflected to a focal point outside of the handpiece in front of the reflector.
