Focusing Tophat beam shaper is an optical device used to convert the incident beam into a focused beam with a flat topped intensity distribution. In general, the beam generated by a laser or light source usually has a Gaussian or approximately Gaussian intensity distribution, meaning that the center brightness is higher and gradually decays towards the edge. However, in some applications, it is necessary to obtain beams with

uniform intensity distribution, that is, Tophat beam. This Tophat beam can provide more uniform illumination, more uniform energy distribution and more accurate focusing effect. Focused Tophat beam shaper changes the intensity distribution of the incident beam through optical design and shape adjustment. It usually consists of lenses, diffraction gratings, optical lens combinations, or other optical components. The combination and configuration of these components can be used to adjust and transform the intensity distribution of the incident beam, making it a flat top shape. At the same time, the focusing Tophat beam shaper can also maintain the focusing performance of the beam, so that the converted Tophat beam has a uniform intensity distribution at the focus. Focusing Tophat beam shapers play an important role in many applications, especially in areas requiring uniform illumination and precise focusing. For example, they are commonly used in fields such as laser processing, lithography, optical transmission, medical imaging, optical measurement, and laboratory research.
