Focused ultrasound tumor ablation machine is a medical device used to treat certain types of tumors, such as uterine fibroids and bone metastases. It uses high intensity

focused ultrasound to destroy tumor tissue without the need for surgery or radiation therapy. The working principle of this machine is to focus ultrasound on the tumor, heating the tissue and ultimately destroying the tumor cells. Ultrasound is transmitted through transducers placed on the skin above the tumor. Treatment is guided by real-time imaging (such as MRI or ultrasound) to ensure accurate tumor targeting. Focused ultrasound tumor ablation machine is a non-invasive treatment option that does not require incision or anesthesia. Patients usually have good tolerance for it and a low risk of complications. Treatment is usually carried out in outpatient settings and does not require hospitalization. This machine is still a relatively new technology and has not yet been widely used. However, it is expected to become a safe and effective treatment option for certain types of tumors. It is important to consult medical professionals to determine whether a focused ultrasound tumor ablation machine is the right treatment option for you.
