Focusing collimators are optical components used to focus and collimate laser beams. It is usually composed of lenses, mirrors, etc., which can focus the laser beam from a large divergence angle to a smaller angle, and make it transmit parallel to the optical axis. Focusing collimators are widely used in laser processing, laser marking, laser measurement, optical communication and other fields. It can realize the focusing and collimation of the laser beam, thereby increasing the energy density and power density of the laser, and realizing high-precision processing, marking and measuring functions. In addition, focusing collimators can also be used for the transmission and coupling of laser beams, so as to realize the connection and matching between lasers and optical

fibers. The design of a focusing collimator needs to consider many factors, such as the focal length, aperture, material and other parameters of the lens, the reflectivity and shape of the mirror, and the wavelength, power and divergence angle of the laser beam. In addition, the manufacture of focusing collimators requires high-precision processing and testing techniques to ensure their optical performance and stability.
