Microcrystalline cellulose (MCC) is a food additive commonly used in the food and pharmaceutical industries. It is derived from purified cellulose, which is a natural polysaccharide found in plant cell walls. MCC is produced by treating cellulose with various acids, resulting in fine, crystalline particles that enhance the functionality of food products. It is commonly used as a stabilizer, thickener, anti-caking agent, and bulking agent in a wide range of food products, including baked goods, dairy products, beverages, and more. MCC is known for its high safety profile, neutral taste, and excellent ability to retain moisture, making it a valuable ingredient in food processing and formulation.

The industry trend for microcrystalline cellulose as a food additive is witnessing sustained growth. As consumers become increasingly conscious of the ingredients in their food and the demand for clean label products rises, MCC is gaining popularity due to its natural origin and versatile functional properties. Its ability to improve texture, stability, and mouthfeel of food products, without altering their sensory attributes, makes it an essential ingredient in various applications. Additionally, as the industry shifts towards healthier product formulations and the reduction of fat, sugar, and calorie content, MCC plays a significant role as a bulking agent and fat replacer. The trend towards convenience foods and the demand for processed food products further contribute to MCC's market expansion.
