Food allergies represent an important health problem all over the world. undeclared allergens as contaminants in food products pose a major risk for sensitized people. In highly sensitized individuals, even the intake of minute amounts of allergens can provoke digestive disorders, respiratory symptoms, skin reaction.

PCR is a complex method in which DNA is extracted from a sample. Specially designed primers anneal to a target fragment of the DNA that is specific for a certain species. Then the polymerase chain reaction takes place, whereby the target DNA is multiplied by a factor of 100 million to 1 billion. Upon addition of a dye, the target DNA fragment can then easily be detected.
