The global Food Anti Caking Agents market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

Anti-caking agents are additives used in powdered or granulated materials such as table salt or confectioneries to prevent lump formation (caking) and to improve packaging, transport, flowability, and consumption. Caking mechanisms vary depending on the material. Crystalline solids frequently cake due to the formation of a liquid bridge and the subsequent fusion of microcrystals. Glass transitions and changes in viscosity can cause amorphous materials to cake. Polymorphic phase transitions can also cause caking. Some anti-caking agents absorb excess moisture or coating particles with a water-repellent coating. Calcium silicate (CaSiO₃), a common anti-caking agent, absorbs water and oil when added to products such as table salt.
