Abstracts

The global Food Grade Potassium Iodate market size is predicted to grow from US$ 48.91 million in 2025 to US$ 74.56 million in 2032; it is expected to grow at a CAGR of 6.3% from 2026 to 2032.

Potassium iodate is an ionic compound in which the ratio of K+ and IO3-ions is equal. Since it is an oxidant, it may cause a fire if it comes into contact with a reducing agent or a combustible material. It is mainly used to iodize table salt through the iodization process. Iodine deficiency is a major cause of preventable intellectual disabilities worldwide, so some iodine derivatives, such as potassium iodate, are added in small quantities to table salt to provide a stable source of iodine in your daily diet. It is also used as dietary iodine and is even added to some infant formula. In 2024, global Food Grade Potassium Iodate production reached approximately 7536 Tons, with an average global market price of around US$ 6250 per ton.The annual production capacity of a single production line is 500 tons, and the gross profit margin is about 30%.

Upstream core raw materials: iodine (I?); potassium hydroxide (KOH) or potassium carbonate (K?CO?): Provides a potassium source and reacts with iodic acid to produce potassium iodate, which must be used in food-grade specifications. Oxidants such as potassium chlorate (KClO?) or hydrogen peroxide (H?O?): Used to oxidize iodine to iodine acid.

Downstream core customers: Iodine addition of salt is the most fundamental and important purpose of food-grade potassium iodate.

Direct material costs account for 80%-90%; manufacturing costs account for 8%-15%; others account for 3%-5%.
