## Abstracts

The global Food Grade Wood Sterol market size is predicted to grow from US\$ 309 million in 2025 to US\$ 473 million in 2032; it is expected to grow at a CAGR of 6.3% from 2026 to 2032.

Food Grade Wood Sterol usually refer to sterols derived from plant sources that meet the quality and safety requirements for food use, mainly  $\beta$ -sterols. They are often obtained by separating and purifying deodorized distillates from plant oils or pulp by-products such as soybean oil, rapeseed oil, and pine pulp. They often appear as white or off white powders or particles, with a typical sterol structure and are insoluble in water but soluble in some oils and organic solvents; Food grade indicates that it meets the requirements for food ingredients or additives in terms of purity, impurity sterol spectrum, heavy metals, polycyclic aromatic hydrocarbons, solvent residues, and microorganisms, and is accompanied by batch testing and traceability documents; In food applications, it is mainly used to strengthen the formula design for reducing cholesterol absorption in food and functional foods. It can also be used as a raw material for nutritional supplements or for stabilizing the structure and improving the taste of emulsion and lipid systems. In 2025, global Food Grade Wood Sterol production reached approximately 529 MT, with an average global market price of around US\$ 596 per kg.

The annual production capacity of food grade sterols is 800 tons, with a gross profit margin of about 25%.

The deodorized distillate produced during the refining process of edible oils such as soybean oil, rapeseed oil, and corn oil in the upstream of the industrial chain.

Midstream manufacturing usually undergoes saponification or hydrolysis pretreatment, solvent extraction and refining, crystallization separation and drying, and meets food use requirements through stricter control of heavy metals, polycyclic aromatic hydrocarbons, solvent residues, and microorganisms.

The downstream main functional food and dietary supplement enterprises are used for plant sterol enhancement and cardiovascular health demand products, followed by food raw material and premix companies for the supply of dairy products, spreads, meal replacements, grains, and other compound products, and the third category is used by some food processing enterprises for lipid system structure stability and taste optimization.

The raw material side usually accounts for about 55% to 75% of the total cost, solvents, adsorption filtration media, and consumables account for about 5% to 12%, energy and utilities such as steam power vacuum cooling account for about 6% to 12%, labor and manufacturing costs account for about 4% to 8%, depreciation and maintenance account for about 3% to 7%, and quality inspection, compliance documents, packaging, warehousing, and logistics account for about 6% to 15%.
