## Abstracts

The global Food Service Distribution Software market size is predicted to grow from US\$ 7917 million in 2025 to US\$ 10610 million in 2032; it is expected to grow at a CAGR of 4.4% from 2026 to 2032.

Food delivery software solutions are digital tools integrating information technology and logistics management, designed to optimize the entire process from order generation to food delivery. Their core function is to aggregate orders from multiple channels, including third-party food delivery platforms, merchant websites, and applications, through a unified platform. This allows for seamless integration with restaurant POS systems and kitchen display systems, automating order processing, menu and inventory management, and delivery route planning. These solutions not only serve food delivery platforms connecting consumers and restaurants but are also widely used in B2B delivery scenarios connecting agricultural product suppliers with canteens and restaurants, as well as in the internal operations management of fresh food e-commerce. Their fundamental value lies in improving operational efficiency, reducing human error and waste, enhancing order status visibility, and providing merchants with deep insights into inventory, sales, and customer behavior through data analytics, ultimately achieving both cost reduction and efficiency improvement, as well as enhanced customer experience.

The food delivery software market has a broad prospect and strong growth momentum. Globally, the market is projected to continue expanding until 2031, driven by factors including consumers' growing expectations for fast and accurate delivery and the trend of catering companies actively integrating automation technologies to improve productivity and business outcomes. In terms of specific applications, the prospects are reflected in three aspects: First, omnichannel integration is becoming a necessity. With

95% of restaurants using online ordering platforms and contributing an average of about a quarter of their revenue, the ability to manage multiple channels has changed from an 'optional' to a 'must-have,' driving up the demand for aggregation platforms. Second, vertical industries are deepening and becoming more intelligent. In niche sectors such as fresh food and group catering, solutions are evolving from basic tools into intelligent systems integrating IoT and AI algorithms, focusing on solving specific pain points such as loss control, cold chain traceability, and intelligent sorting. Finally, the target audience is diversifying. The software market is further segmenting itself according to different end users such as restaurants, delivery service providers, and cloud kitchens, and providing different types of products based on websites or mobile devices to meet the needs of differentiated business models.
