Forage Dehydrator is a type of agricultural processing equipment used to rapidly remove excess moisture from fresh forage (such as alfalfa and ryegrass) under controlled conditions. Its core objective is to reduce moisture content, inhibit mold and spoilage, while preserving as much of the forage's nutrients, color, and palatability as possible. This equipment typically achieves continuous dehydration of forage through hot air, low-temperature circulation, or multi-stage drying processes. It is widely used in industrialized forage processing, large-scale ranches, and centralized forage supply systems, serving as a crucial link between field harvesting and high-quality forage storage and transportation. In 2025, sales reached 55,000 units, with an average price of US\$12,000, a total capacity of 60,000 units, and a gross profit margin of 33%.
