Forage Grass Seed refers to the reproductive unit of herbaceous plants specifically bred and cultivated to produce high-quality biomass for livestock consumption. Unlike turfgrass used for landscaping, forage grass varieties are evaluated based on their nutritional profile—specifically their crude protein content, digestibility, and fiber structure (ADF/NDF). These seeds are the starting point for establishing permanent or temporary pastures, providing the primary energy source for ruminants such as cattle, sheep, and goats. Key species include Perennial Ryegrass, Tall Fescue, and Orchardgrass, which are often selected for their ability to withstand heavy grazing, rapid regrowth cycles, and adaptability to specific soil and moisture conditions.

In 2025, global Forage Grass Seed production was 700000 MT and average price was 2500 USD/MT, with gross margin 20%.
