A forage needle sampler is an agricultural tool specifically used to collect forage samples. It usually consists of a slender metal needle tube that can be directly inserted into the stems and leaves of forage to extract internal samples. Its design makes the sampling process fast, convenient and representative, avoiding the impact of ground impurities and external pollution on sample quality. Forage samples collected by the needle sampler can be used to analyze the nutritional composition, water content, fiber content and other chemical indicators of the forage, thereby helping farmers and herdsmen scientifically evaluate forage quality, reasonably adjust feeding plans, and improve livestock production efficiency. In addition, forage needle samplers are widely used in forage growth monitoring, feed management and agricultural scientific research, and are an important tool for ensuring forage quality and livestock health.Sales in 2024 will be 204,000 units, with an average price of US$270 per unit.The single-line production capacity reaches 15,000.
