A forced circulation water cooling system is a cooling system used to dissipate heat generated by equipment or machinery. It is commonly employed in industries like power generation, chemical plants, and refineries. In a forced circulation water cooling system, water is continuously circulated through the system by a pump to cool the equipment. The water flows into a heat exchanger where the heat is removed before the cooled water is pumped back into the system. The system works on the principle that water absorbs heat as it moves through the equipment, and the heat energy is then carried away by the water.
