The global Foreign Body Identification Services market size is predicted to grow from US\$ 668 million in 2025 to US\$ 956 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

Foreign object detection (FOD) services utilize advanced sensor technology combined with artificial intelligence algorithms to automatically detect, identify, and locate unwanted foreign substances in products or materials. Its core lies in distinguishing foreign objects from the background through a series of steps including image acquisition, data preprocessing, feature extraction, and intelligent classification. This service is widely used in food, pharmaceuticals, electronics, mining, and manufacturing industries, aiming to replace traditional, inefficient manual visual inspection. It automatically detects impurities such as metal fragments, plastics, glass, and biological residues, thereby strictly ensuring product quality, production safety, and process compliance. It is a key link in intelligent quality control.

The FOD service market has broad prospects and is rapidly developing towards higher precision, faster speed, and greater intelligence. The core driving force behind its growth is the increasingly stringent regulatory requirements for product quality and safety globally, as well as the urgent need for cost reduction and efficiency improvement in the industrial sector's 'intelligent transformation and digital upgrading.' According to industry analysis, the global FOD system market has already reached a considerable scale and is expected to maintain stable growth in the coming years. From a technological trend perspective, the integration and application of artificial intelligence, especially deep learning, is the core development direction. This enables systems to possess multimodal perception and autonomous decision-making capabilities, allowing for real-time identification of micron-level defects and significantly improving detection

efficiency and accuracy. Furthermore, the combination of quantum sensing, novel imaging technologies, and edge computing is continuously pushing the physical limits of detection, driving the service to evolve from a simple 'detection tool' into a 'systematic solution' capable of predicting risks, indicating a huge potential for market upgrades.
