Formed wire, commonly used in engineering, is formed through a process known as wire forming, which is finished wire manufactured using spools into specific configurations. The method applies force to change the profile of the wire through different techniques, all of which have the characteristic of imparting a specific type of shape. Formed wire line splices are used to connect or repair pull wires or oblique wires. The splices are located in the center of the damaged point and will restore the full tensile strength of the cable or cable. It has a wide range of significance in all aspects. With the European region and the Asia-Pacific overall power The laying of the network has a huge market growth space.

The formed wire line splice is used to connect or repair guy wire or messenger strand. The strand splice has a rated holding strength which is equivalent to the rating of the wire or strand to which it is applied. Splices can be used to form a stopper at the end of a line, to form a loop or an eye in a rope, or for joining two ropes together. Splices are preferred to knotted rope, since while a knot typically reduces the strength by 20–40%, a splice is capable of attaining a rope's full strength.
