The global Forward Controllers market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

A Forward controller is a type of power electronics controller used in a Forward converter, which is a DC-to-DC converter that uses a transformer to transfer energy from the input to the output. The Forward controller regulates the output voltage by controlling the switching of the power semiconductor devices in the converter.

The basic operation of a Forward converter involves the switching of a primary-side transistor that controls the current through the primary winding of the transformer. The energy stored in the transformer is then transferred to the secondary winding, where it is rectified and filtered to produce the desired output voltage.

The Forward controller is responsible for regulating the output voltage by adjusting the switching frequency and duty cycle of the primary-side transistor. It typically operates in continuous conduction mode (CCM), meaning that the current in the primary winding of the transformer is continuous during each switching cycle.

United States market for Forward Controllers is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Forward Controllers is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
