The global Foundry Residues Recycling market size is predicted to grow from US\$ 629 million in 2025 to US\$ 979 million in 2032; it is expected to grow at a CAGR of 6.6% from 2026 to 2032.

Foundry residues recycling mainly refers to the collection, classification, and processing of waste generated during the casting process, so as to realize the reuse of resources. These residues may include waste sand, waste residue, scrap metal, etc., which usually contain valuable materials. With professional technology and equipment, these materials can be extracted and used in new production activities to achieve a circular economy.

With the continuous advancement of science and technology, new residue recovery technologies will continue to emerge, such as more efficient classification and separation technologies, and more environmentally friendly treatment methods. These technologies will help improve the efficiency and quality of residue recycling and reduce energy consumption and emissions during the recycling process.
