The global Four Cylinder Engine market size is predicted to grow from US\$ 25010 million in 2025 to US\$ 31300 million in 2032; it is expected to grow at a CAGR of 3.3% from 2026 to 2032.

A four cylinder engine is an internal combustion engine with four cylinders arranged in a straight line (inline-four) or occasionally in a flat or V configuration. It is one of the most common engine types used in passenger vehicles due to its balance of performance, fuel efficiency, and compact design. Typically operating on a four-stroke cycle, four-cylinder engines deliver smooth and reliable power, making them ideal for compact cars, sedans, and even some SUVs. Advances in turbocharging and direct fuel injection have significantly enhanced their output and efficiency, enabling smaller engines to meet stricter emission standards while maintaining strong performance.

The market for four-cylinder engines is driven primarily by the global demand for fuel-efficient, cost-effective, and environmentally friendly vehicles. As regulatory pressures on emissions intensify, automakers are increasingly turning to downsized engines with advanced technologies—such as turbocharging, direct injection, and hybrid integration—to meet performance expectations while reducing fuel consumption and CO₂ emissions. Additionally, the rising production of compact and mid-size passenger cars, particularly in emerging markets, continues to support steady demand for four-cylinder powertrains. Their lower manufacturing cost, mechanical simplicity, and proven reliability make them a preferred choice for both internal combustion and hybrid vehicle platforms.
