Four-roller roller benders are advanced bending machines designed to form metal sheets, plates, or bars into curved or cylindrical shapes with high precision and efficiency. Unlike three-roller benders, these machines feature an additional roller that provides greater control and stability during the bending process. The top roller is typically the driving roller, while the two side rollers adjust to shape the material, and the fourth roller holds the workpiece securely to minimize slippage and improve accuracy. Four-roller roller benders are ideal for creating symmetrical curves, cones, and circular components and are commonly used in industries such as manufacturing, shipbuilding, and construction. Their ability to pre-bend and roll materials in a single operation enhances productivity and ensures superior quality.
