A four-wheel laser ground leveling robot is an automated surface grading machine integrated with laser navigation and intelligent control systems. It typically consists of a four-wheel mobile chassis, laser sensors, a leveling mechanism, a positioning system, and a control unit. By scanning ground elevation in real time and using laser guidance combined with closed-loop control, the robot automatically adjusts its leveling tools to achieve high-precision surface grading. It is widely used in road construction sites, runway surface laying, sports fields, construction excavation sites, and agricultural surface leveling tasks.

The upstream of the four-wheeled laser ground leveling robot industry chain mainly consists of suppliers of core components and raw materials such as laser sensors, navigation modules, controllers, hydraulic systems, vehicle bodies, and tires. Representative suppliers include Leica Geosystems, Trimble, Bosch Rexroth, and Continental. The midstream consists of robot manufacturers and automatic control system integrators, responsible for equipment design, laser navigation integration, and software development. Downstream application industries include building construction, road engineering, stadium construction, airport runway maintenance, foundation pit construction site leveling, and agricultural land leveling. Typical application companies

or construction units such as Vinci Construction, Bechtel, and China State Construction Engineering have achieved high-precision and high-efficiency ground leveling operations by deploying these robots.
