## Abstracts

The global FPC Polyimide Coverlay Material market size is predicted to grow from US\$ 613 million in 2025 to US\$ 787 million in 2031; it is expected to grow at a CAGR of 4.3% from 2025 to 2031.

FPC Coverlay consists of a solid sheet of polyimide with a layer of flexible adhesive. Coverlay plays the exact same function as a solder mask on rigid boards but only for flexible printed circuit boards (PCBs). Conventional solder masks have only a limited bendability, so for flex circuits that require greater bendability, coverlay is bonded (glued) on to encapsulate and protect the external copper circuit layers of a flexible printed circuit (FPC).

Flexible Printed Circuit (FPC) polyimide coverlay materials are gradually gaining prominence in the electronics industry. As consumer electronic devices become thinner and lighter, the demand for high-performance and highly reliable flexible circuit boards continues to increase. Polyimide coverlay materials are favored for their excellent heat resistance, chemical resistance, and good electrical insulation properties. Market trends indicate that the demand for flexible circuit boards will continue to grow with the proliferation of 5G technology, the Internet of Things (IoT), and wearable devices. Furthermore, the automotive electronics sector represents a significant potential market, with flexible circuit boards finding extensive applications in automotive internal wiring and sensor applications. Therefore, FPC polyimide coverlay materials will continue to play a pivotal role in meeting the growing demands of electronic devices in the future.
