The global FPR2 Ligand for Research Use market size is predicted to grow from US\$ 124 million in 2025 to US\$ 359 million in 2032; it is expected to grow at a CAGR of 17.0% from 2026 to 2032.

The gross profit margin of the FPR2 Ligand for Research Use industry is 50%-70%.

N-formyl peptide receptor 2 (FPR2, also often referred to as FPR2/ALX) ligands are molecules that can specifically bind to the FPR2 receptor and initiate or block its signal transduction. FPR2 belongs to the G protein-coupled receptor (GPCR) family, and its ligands have a very diverse source and structure, including endogenous inflammatory mediators (such as lipoxigenin and resolving agents), various peptides/proteins, and synthetic small molecules and tool peptides.

From the perspective of 'raw materials and manufacturing routes,' FPR2 ligands can be broadly divided into three categories: Peptides (such as WKYMVm, WRW4, PBP10, etc.) mainly rely on solid-phase peptide synthesis (SPPS), with raw materials primarily consisting of amino acid monomers, resins, coupling reagents, and a large amount of organic solvents. Costs are typically determined by sequence length, the difficulty of synthesis due to hydrophobicity, and purification/analysis (HPLC, MS) and purity level (research grade vs. GMP). This category generally exhibits a cost structure of 'scalable but with a high proportion of purification.' In contrast, lipid mediators (such as LXA4, RvD1) commonly suffer from unstable chemical structures, complex stereo/geometric isomers, and high requirements for purification and preservation. Therefore, 'effective yield + quality control' often drives up unit costs and frequently requires supply chain conditions such as low temperature, light protection, and antioxidants.

For proteins/large peptides (such as Annexin A1 or its fragments/peptides), cost depends more on the recombinant expression system/purification process or the difficulty of peptide synthesis. The overall conclusion is that, under the same quality requirements of 'high purity, traceability, and low endotoxin,' lipid mediators are usually the most expensive and sensitive to storage and transportation; protein costs fluctuate the most (strongly correlated with the process); and short peptide costs are relatively controllable but significantly dependent on purification and scale-up processes.
