Fractional flow reserve (FFR) is the 'gold standard' to measure whether to implant a cardiac stent, which is more comprehensive and accurate than coronary angiography. FFR sends the pressure guide wire into the coronary artery, and helps doctors judge

whether the vascular stenosis affects the blood supply of the coronary artery when the coronary artery hyperemia caused by the drug load is in the state of maximum expansion, so as to determine whether vascular intervention is needed. Generally, the FFR value is ≥ 0.75 , which indicates that vascular stenosis has seriously affected the blood supply demand of the distal coronary artery. At this time, endovascular stent treatment must be performed, while the FFR value > 0.8 may consider conservative drug treatment. The clinical application of this blood flow reserve measurement technology has changed the previous history of diagnosis based on anatomy and experience, allowing doctors to make more scientific and accurate judgments on whether patients with coronary heart disease need vascular intervention.
