The global Fractional Flow Reserve market size is predicted to grow from US\$ 1093 million in 2025 to US\$ 2116 million in 2031; it is expected to grow at a CAGR of 11.6% from 2025 to 2031.

Fractional flow reserve (FFR) is a technique used in coronary catheterization to measure pressure differences across a coronary artery stenosis (narrowing, usually due to atherosclerosis) to determine the likelihood that the stenosis impedes oxygen delivery to the heart muscle (myocardial ischemia). FFR is a novel and potentially clinically useful mathematical solution for estimation of stenotic coronary artery atherosclerosis. Reliability/collaborative measurement between capable laboratories in measuring this essential metric appears muddled in a proprietary race to claim cardiac mathematics dedicated to risk in ischemic cardiac disease. Proprietary claims of cardiac mathematics have not been previously argued in patent law. Fractional flow reserve is defined as the pressure after (distal to) a stenosis relative to the pressure before the stenosis. The result is an absolute number; an FFR of 0.80 means that a given stenosis causes a 20% drop in blood pressure. In other words, FFR expresses the maximal flow down a vessel in the presence of a stenosis compared to the maximal flow in the hypothetical absence of the stenosis. This report studies the device for Fractional Flow Reserve.

Global Fractional Flow Reserve key players include Philips, Abbott, Boston Scientific, Bracco, Opsens, etc. Global top five manufacturers hold a share about 95%. North America is the largest market, with a share about 45%, followed by Europe, with a share about 25 percent. In terms of application, the largest application is Multi-vessel disease, occupied for a share of 63%.
