The global Fractionating Towers market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of %from 2025 to 2031.

Fractionating Tower is an essential item used in the distillation of liquid mixtures to separate the mixture into its component parts, or fractions, based on the differences in volatilities.

We believe that the recovery of new coal chemical projects in recent years is not a simple economic cycle, but the joint effect of industrial technological breakthroughs, demonstration improvements, and expansion of oil-to-coal ratio, which has brought about the improvement of industrial production efficiency and the reduction of production costs, which has enhanced the competitiveness of the industry , making new coal chemical projects compete with petrochemical projects on the same platform for the first time. New coal chemical projects have changed from the original demonstration supplement to petrochemical projects to substantive domestic competition and substitution of low-end petrochemical products. The upward trend of the coal chemical equipment industry is just beginning.
