The global Frequency Conversion IC market size is predicted to grow from US\$ 2055 million in 2025 to US\$ 4134 million in 2032; it is expected to grow at a CAGR of 10.6% from 2026 to 2032.

A frequency conversion IC refers to an integrated circuit designed to perform the frequency up-conversion or down-conversion of electrical signals; in English, these are typically referred to as Frequency Conversion ICs, RF Mixer ICs, or Up/Down Converter ICs. Their core function?facilitated by circuits such as mixers, oscillators, local oscillator (LO) inputs, filters, amplifiers, and I/Q modulators/demodulators?is to mix an input signal with a local oscillator signal. This process converts baseband or intermediate frequency (IF) signals into the radio frequency (RF) or microwave bands, or conversely, converts RF or microwave signals into IF or baseband signals. These chips are widely deployed in wireless communication systems, 5G base stations, satellite communications, radar systems, electronic warfare, broadcasting and television equipment, test and measurement instruments, IoT terminals, and RF transceiver systems, serving as critical components within RF front-ends and communication transceiver chains.

The upstream segment of the frequency conversion IC industry chain primarily encompasses EDA tools, RF/analog IP cores, semiconductor materials, process platforms (including silicon-based CMOS, SiGe, GaAs, GaN, and SOI), wafer foundries, lithography masks, packaging substrates, ceramic packages, test probes, and RF test equipment. The midstream segment consists of enterprises engaged in the design, manufacturing, and packaging/testing of frequency conversion chips; their product portfolio includes RF mixer ICs, upconverter ICs, downconverter ICs, I/Q modulators/demodulators, frequency synthesizers, PLLs, LO amplifiers, and integrated

RF transceiver chips. The downstream segment focuses on applications within 5G base stations, satellite communications, radar systems, electronic warfare, test and measurement, broadcasting and television, IoT terminals, wireless communication modules, and military communication systems. The gross margin for frequency conversion chips stands at approximately 45%.

In 2025, the average price of frequency conversion IC is projected to be \$15 per unit, with a sales volume of 140.06 million units and a total production capacity of 200 million units.

The market for frequency conversion IC is expected to maintain relatively stable growth in the future, driven primarily by advancements in 5G/6G communications, satellite internet, phased array radar, millimeter-wave radar, electronic warfare, test and measurement equipment, and upgrades to broadband wireless communication devices. As system frequency bands evolve toward higher frequencies, wider bandwidths, and multi-channel architectures, downstream customers are placing increasingly stringent demands on frequency conversion chips regarding low noise, high linearity, low phase noise, high isolation, miniaturization, and high integration. Consequently, traditional discrete mixers are evolving toward integrated Up/Down Converters, I/Q modulators/demodulators, broadband MMICs, and RF SoCs. In the future, the focal point of market competition will extend beyond the performance of individual chips to encompass process platforms, packaging and testing capabilities, RF system design expertise, domestic substitution capabilities, and the ability to engage in collaborative development with end-system manufacturers. Particularly within the fields of satellite communications, military radar, and millimeter-wave applications, manufacturers possessing advanced high-frequency design capabilities, robust reliability verification processes, and the capacity for small-batch customization will hold a distinct competitive advantage.
